

ZEPHYRUS · HOSPITAL OPERATIONS PLATFORM

One plan, one deck, one model — *and the ROI at every layer.*

589%

return on each acquisition dollar

6–13×

customer ROI per hospital, sourced

\$1.20

lifetime capital per \$1 of ARR

Reconciles ACUM-ZEP-FIN-DECK-001 (The Fifteen Numbers, Jul 11) with Business Plan v2.0 + Financial Model (ACUM-BIZ-ZEPH-002, Jul 17). Every divergence shown, every choice explained — nothing quietly changed.

Three documents. One set of numbers.

METRIC	DECK-001 · JUL 11	PLAN v2.0 · JUL 17	THIS DECK — RESOLUTION
First institutional raise	\$7M validation · Jan-27	\$15M Series A · H2-26	\$7M Jan-27 — matches product reality (candor slide)
Total staged capital	\$23M (\$1M seed + \$7M + \$16M)	\$40M (\$15M A + \$25M B)	\$23M base · \$40M labeled accelerated option
Year-5 ARR (base)	\$20.1M (2031) · 36 logos · 55 sites	\$48.9M (2030) · 159 hospitals	\$20.1M base · \$35.6M upside · \$48.9M accelerated
Blended ACV	\$300K → \$365K per site (module stack)	\$203K → \$289K net of launch discounts	Same list stack — v2.0 nets off 25 → 5% early discounts
SAM (US 200+ beds)	\$725M · 1,404 hospitals (CMS certified)	\$821M · 1,462 hospitals (AHA staffed)	\$725–821M — two independent counts, 12% apart
LTV : CAC (year 5)	6.9× (5-yr capped CLV)	6.0–8.6× (7-yr life)	6.9× — keep the stricter 5-yr cap
NRR steady state	110%	106–107%	106–110% band; expansion only after measured results
EBITDA break-even	2031 (+\$0.06M)	During 2029 (+20% margin 2030)	2031 base; 2029–30 only under accelerated capital
EV · base case	~\$160M (8× ARR) · 6.7× capital	~\$391M (8× ARR)	\$160M base · \$390M accelerated — same 8× lens

The deck's discipline, the plan's evidence

KEPT FROM DECK-001 (THE FIFTEEN NUMBERS)

- Staged, evidence-gated capital: \$7M validation now, \$16M scale at M19 — gates, not calendar
- 2027 revenue start — consistent with the candor slide: security remediation and production EHR connectors come first
- $ARR \equiv \text{sites} \times \text{ACV identity}$, enforced by a model check every year
- The two WARN flags, disclosed — OpEx capacity gap and the year-1 cash-buffer dip
- 5-yr-capped CLV and strict unit-economics definitions

ADOPTED FROM PLAN v2.0 + FINANCIAL MODEL

- Sourced problem quantification: margins, OR \$/minute, boarding minutes, RN-turnover economics
- Per-hospital customer ROI model — the number that actually closes hospital deals (6–13×)
- Independent AHA-based SAM cross-check (\$821M vs \$725M CMS) — the sizing now has two legs
- Benchmark context: KeyBanc payback medians, Benchmarkit NRR bands, healthy LTV:CAC bars
- An explicit accelerated case (\$40M staged) so ambition is labeled, never smuggled into the base

RULE The base case is what the current product state and \$23M of gated capital support. Everything faster is labeled accelerated and priced separately.

The operational losses are measured, not anecdotal

1–2%

median hospital operating margin; ~40% of US hospitals lose money on operations

KAUFMAN HALL 2025 · ADVISORY BOARD

\$36–46

cost of one OR minute — while prime-time utilization runs 60–75% vs the 80–85% target

JAMA SURGERY 2018 · LIT. REVIEW 2022

190 min

median ED boarding for admitted patients — up ~60% vs the 2013–19 baseline; ~5 hrs at large EDs

ACEP / ENA COMPENDIUM

\$5.19M

average annual cost of RN turnover per hospital — 17.6% turnover at \$60,090 per departure

NSI RETENTION REPORT 2026

Per hospital: 6–13× return on the subscription

CUSTOMER ROI

identified annual value ÷ platform subscription

$\$2.1\text{--}4.0\text{M} \div \$300\text{--}365\text{K} = 6\text{--}13\times$

VALUE LEVER	MECHANISM	ANNUAL VALUE	TYPE
OR utilization +2–4 pts	Fill released block time — ~\$40/min × recovered prime-time minutes	\$1.0–2.0M	Hard
ED walkouts –0.5–1.0 pt	≈600 retained visits × ~\$600 average net revenue	\$0.2–0.4M	Hard
RN turnover –1–2 pts	\$289K per point of turnover (NSI 2026)	\$0.3–0.6M	Hard
Boarding / LOS –0.2–0.3 days	Excess-day cost avoidance at ~\$1,300/day variable cost	\$0.5–0.8M	Soft
Improvement-analyst leverage	OCEL process mining replaces weeks of manual mapping	\$0.1–0.2M	Soft

THE FLOOR

Hard dollars only: \$1.5–3.0M against a \$365K fully-built site — a 4–8× floor before counting a single soft dollar.

Representative 400-bed hospital: 12 ORs · 60K ED visits · 20K admissions

Why it matters to investors: a 4–8× hard-dollar floor is what sustains 92–94% gross retention, 110% NRR, and pricing power — the retention math on slides 8–11 is downstream of this table.

Two independent bottom-ups land within 12%

LENS A · CMS CERTIFIED BEDS (DECK-001)

\$725M SAM

1,404 hospitals with 200+ certified beds

- TAM \$1.10B across 4,232 sites — every acute, children's & critical-access hospital with emergency services
- Planning ACVs \$90K–\$750K by bed class
- Beachhead: 1,023 hospitals of 200–499 beds

LENS B · AHA STAFFED BEDS (PLAN v2.0)

\$821M SAM

1,462 hospitals with 200+ staffed beds

- TAM \$986M across 2,564 hospitals of 100+ beds — displaceable point-solution spend at observed price points
- Calibrated to LeanTaaS \$400K+/workflow, TeleTracking, EDIS, WFM \$75–300K
- Beachhead: 877 hospitals of 300+ beds (\$616M)

SAM \$725–821M — different federal datasets, different ACV ladders, same answer. Base-case SOM stays humble: \$20.1M = 2.8% of SAM dollars by 2031. A sizing, not a forecast.

Five-year build — gated, with the throttle visible

Every stage transition is an evidence gate — references, connectors, install time, margin, security posture. Hiring, spending, and the scale raise wait for proof. YoY ARR growth: 225% → 151% → 116% → 90%.

ACCELERATED OVERLAY If the 2028 gates land early and the scale round upsizes to \$25M, Plan-v2.0 capacity math (AE-throttled: 14 → 30 → 50 → 68 new hospitals/yr) supports \$35–49M ARR by 2031. Same gates — more fuel after they pass.

The Fifteen Numbers — reverified, unchanged

01 · CAC \$220K per new logo — down 45% from \$400K	02 · CLV \$1.51M gross-profit LTV per site, 5-yr cap	03 · ARR \$20.1M 55 sites × \$365K — identity enforced	04 · MRR \$1.67M December-2031 run-rate	05 · ROI 589% net return per acquisition dollar
06 · BURN 0.14× bar < 1.0× elite territory PASS	07 · EBITDA +\$0.06M break-even inside the window PASS	08 · CHURN 6.0% of beginning ARR — from 8% in yr 2	09 · LTV:CAC 6.9× healthy bar 3× crossed 2028 PASS	10 · NRR 110% expansion outruns churn — bar 100% PASS
11 · GM 74.0% blended, from 55% in year 1	12 · OP MARGIN -1.7% D&A gap after EBITDA break-even WATCH	13 · PAYBACK 8.7 mo bar 12 months — crossed 2030 PASS	14 · RULE OF 40 94 growth + margin — clears 40 in 2030 PASS	15 · RUNWAY \$4.4M EOY-31 cash, above \$4.0M buffer WATCH

Return on the acquisition dollar

$ROI = (CLV - CAC) \div CAC$

$(\$1.515M - \$0.220M) \div \$0.220M = 589\%$

READ IT AS CASH

\$1.00 of CAC → \$6.89 gross profit
net of the dollar → \$5.89 kept

*Numerator is 5-yr-capped gross profit, not revenue —
the strict version of the metric.*

CAPITAL-LEVEL VIEW

\$24M lifetime capital stands behind \$20.1M of
ARR at 110% NRR — \$1.20 of capital per \$1 of
self-compounding recurring revenue.

Both bars crossed inside the plan window

Benchmark context: B2B SaaS median payback is ~20 months (KeyBanc 2024); enterprise NRR medians run 110–118% (Benchmarkit 2025). Doubly conservative: per-site CLV against whole-logo CAC, while the average logo runs 1.5 sites by 2031.

The book compounds; the burn disappears

CHURN · NRR TRAJECTORY

YEAR	CHURN	NRR	GATE
2027	— assumed	100%	No expansion credit in year 1 — by design
2028	8.0%	103%	Expansion only after measured results
2029	7.0%	105%	Module 2–3 attach on referenced sites
2030	7.0%	108%	Multi-site logos begin (1.4 sites/logo)
2031	6.0%	110%	GRR 94% · expansion outruns churn

FY2031 ARR bridge (\$M): 10.59 – 0.64 churn + 1.69 expansion + 8.43 new = 20.08

Rule of 40: 7 → 38 → 84 → 94 across 2028–2031 — small-base growth flatters it early; weight 2030–31, when the base is \$9.4M and \$18.3M.

BURN MULTIPLE — DOLLARS BURNED PER NET-NEW ARR DOLLAR · 1.0× BAR (GOLD)

Under 1.0× is elite; the plan crosses in 2030 and finishes at 14 cents per new recurring dollar. Net burn includes working capital and capex — not an EBITDA proxy.

Staged, gated — with a priced acceleration option

FIVE EVIDENCE GATES FOR THE SCALE ROUND

ACCELERATION OPTION Gates passed early → scale round upsizes toward \$25M (Plan-v2.0 structure, \$40M lifetime). Funds 4 AE pods instead of 2; base \$20.1M becomes \$35–49M by 2031; break-even pulls from 2031 toward 2029–30. Ambition is a priced option on evidence — never the base.

Year-5 outcomes — four labeled worlds

DOWNSIDE \$7.8M ending ARR · 18 logos · 24 sites EBITDA-2.74M Capital-need indicator+6.7M Hiring throttle75% of plan Early retrenchment or added capital — the model says so on its own Scenarios tab.	BASE — THIS PLAN \$20.1M ending ARR · 36 logos · 55 sites EBITDA+0.06M Ending cash vs buffer\$4.4M vs \$4.0M Hiring100% of plan All fifteen scoreboard numbers come from this column.	UPSIDE \$35.6M ending ARR · 58 logos · 95 sites EBITDA+4.87M Capital-need indicator\$0 Hiring115% of plan Same two raises — upside flows to cash, it doesn't get spent.	ACCELERATED \$48.9M ending ARR · 159 hospitals (Plan v2.0 ramp) Capital\$40M staged EBITDA 2031≈ +20% margin Requiresgates early + \$25M scale The v2.0 trajectory, priced as an option — not blended into the base.
---	--	--	---

What the capital turns into

The driver is capital efficiency, not the multiple. \$20.1M of ARR on \$24M of lifetime capital — \$1.20 per recurring dollar at 110% NRR — means ownership stays concentrated; conventional paths to the same ARR raise 2–3× more and dilute accordingly. The accelerated case spends \$40M to reach \$48.9M (\$0.82 per recurring dollar) — better efficiency, taken only after the evidence gates pass.

Illustrative only. Multiples (5–8× ARR, mid-range of healthcare-SaaS transactions) and timing are assumptions, not commitments — the plan sets no valuation. Actual returns depend on terms, dilution, performance, and exit conditions. Not an offer or a guarantee of returns.

The two flags the model still raises

FLAG 1 · OPEX CAPACITY

WARN

-\$1.62M

2031 gap — bottom-up OpEx vs business-plan cap

Role-level HR and technology schedules cost more than the plan-calibrated OpEx targets from 2028 onward: -\$0.17M → -\$0.64M → -\$1.04M → -\$1.62M.

MANAGEMENT ACTION

Slower hiring, lower cash comp, or higher ARR per FTE — the \$309K ARR/employee assumption is the lever, reviewed before every hiring and fundraising commitment.

FLAG 2 · YEAR-1 BUFFER DIP

WARN

-\$0.18M

EOY-2027 cash \$3.82M vs \$4.0M board minimum

Ending 2027 cash sits just below the board's minimum buffer, and the pre-raise trough reaches \$1.29M in month 18 — about three months of cover.

MANAGEMENT ACTION

Sequencing, not hope: the validation round is sized for 18 months, the scale round is evidence-gated at M19, and the buffer is restored in every year thereafter.

11 / 11 structural checks PASS — revenue bridges, cash roll-forward, allocation totals. These two flags are also why the base case, not the accelerated case, is the plan.

What we are not claiming

No \$8.5B TAM. The v1.0 figure blended analyst categories Zephyrus doesn't sell into. The bottom-up SAM is \$725–821M — big enough, and real.

Not production-ready today. Security remediation, live EHR connectors, and HA/DR are the first 18 months of the validation round — the gap is named, concentrated, and funded.

No blended ambition. The accelerated \$48.9M path exists only as a labeled option behind the same evidence gates, with its own \$40M capital plan.

No 43:1 LTV:CAC. The honest ratio is 6.9× on a 5-yr cap with fully-loaded ~\$220K CAC — still exceptional, and it survives diligence.

No expansion credit before results. NRR is 100% in year 1 by construction; module expansion is earned by measured outcomes, then modeled.

No valuation set by this deck. EV figures are illustrative multiples on modeled ARR — terms belong to the term sheet, not the plan.

ACUMENUS, INC. · ZEPHYRUS

THE ASK

\$7M proves it. \$16M scales it.
Evidence gates every dollar — and every claim.

NOW · VALIDATION

\$7M

18 months of proof: security, connectors, paid design partners, founder-led sales.

GATED · SCALE

\$16M

Unlocked by 3+ references · \$2–4M ARR · 2 connectors · <150-day installs · >75% sub GM.

BY 2031 · LANDS AT

\$20.1M ARR

36 logos · 55 sites · 74% GM · EBITDA break-even — on \$23M staged, \$1.20 per recurring dollar.

589% ACQ ROI · 6.9× LTV:CAC · 8.7 MO PAYBACK · 0.14× BURN · 110% NRR · RULE OF 40 = 94 · 2 FLAGS DISCLOSED

The model is in the data room — change any assumption and all fifteen numbers recompute. **Sanjay M. Udoshi, MD · Founder ·**
